MINISTRY OF DEFENCE

Foreword by the Secretary of State for Defence the Right Honourable Geoff Hoon MP

In the Defence White Paper of last December I set out the need to defend against the principal security challenges of the future: international terrorism, the proliferation of Weapons of Mass Destruction, and weak and failing states. Our need in the future is for flexible and adaptable armed forces properly supported to carry out the most likely expeditionary operations. To create a more sustainable and affordable force structure which better meets these operational requirements we have secured additional resources: the 2004 Spending Review allocated £3.7 billion to defence across the Spending Review period, which represents an average real terms increase of 1.4% a year. Additionally, we shall also generate resources to strengthen the front line through our comprehensive efficiency and rationalisation plans, the benefits of which will be ploughed back into the defence budget. As indicated in the White Paper, we are pursuing radical change in the future force structure, reducing force levels in some capabilities in order to invest more in higher priority capabilities better able to achieve the effects we will require. We will increase our capacity to undertake expeditionary operations alongside an equipment programme that is delivering, and will continue to deliver, an advanced range of capabilities. The result will ensure that the resources the Government commits to Defence are deployed to optimum effect. The Chiefs of Staff support the radical change we are pursuing and have been instrumental in its preparation.

Chapter 1

Introduction

1.1 The Defence White Paper set out our analysis of the future security environment, the implications for defence, our strategic priorities and how we intend to adapt our planning and force structures to meet potential threats. This policy was an evolution of the strategy contained in the 1998 Strategic Defence Review (SDR), and built on the conclusions of the 2002 SDR New Chapter and recent operational experience. Crucially, it demonstrated the need to adapt to the more pronounced threats presented by international terrorism and the proliferation of weapons of mass destruction (WMD) and the challenges posed to the international community by weak and failing states.

1.2 The White Paper set out a revised set of assumptions which underpin future planning. These include:

- An expanded regional focus beyond the core regions set out in the Strategic Defence Review of Europe, the Near East, North Africa and the Gulf, to reflect the requirement to operate further afield across sub-Saharan Africa and South Asia, and to meet the wider threat from international terrorism on a global basis.
- The need to strike the right balance of capabilities for expeditionary operations to meet the demands of our eight strategic effects - Prevent, Stabilise, Contain, Deter, Coerce, Disrupt, Defeat and Destroy.

- The need to optimise our force structure to support three concurrent small and medium scale¹ operations (rather than two in the SDR) including the capability to lead or be framework nation for coalition operations where the US is not involved.
- The retention of the flexibility to reconfigure for less frequent large scale operations, while concurrently conducting a small scale operation. The full spectrum of capabilities is not required for large scale operations, as the most demanding operations could only conceivably be undertaken alongside the US, either as a NATO operation or a US led coalition, where we have choices as to what to contribute.
- The importance of the continued transformation of our forces to concentrate on the characteristics of speed, precision, agility, deployability, reach and sustainability. Key to this is our ability to exploit the benefits of Network Enabled Capability, precision munitions and the development of effects-based planning and operations.
- The importance of those capabilities which can rapidly come together to achieve specific military effect and then rapidly adapt with other capabilities to achieve what is required by the next operation. By doing so decisive military effect may be achieved through a smaller number of more capable, linked assets acting quickly and precisely to achieve a desired outcome.

- The need to ensure that the organisation of our Armed Forces reflects the reasonable aspirations of our people in the 21st Century in terms, for example, of greater geographic stability in their home lives.
- Continued support to the Home Office and other civil authorities charged with the safety and security of the UK, both through routine military tasks and our preparedness to support them in a time of crisis.

1.3 Based on this analysis the White Paper set out a revised set of 18 Military Tasks, both standing and contingent, with the range of strategic effects our armed forces need to be capable of delivering. Extensive work has been undertaken to identify the future force structure and the development of capability in the longer term. An illustration of how we match capability against military tasks is attached at Annex. As new capabilities come into service such calculations will change, particularly with our increasing focus on effects achieved by combinations of flexible and adaptable forces.

¹ An example of a small scale operation was the UK's deployment to Macedonia in 2001; Afghanistan (2001) was at medium scale; and Operation TELIC large scale.

Force Structure Changes - Key Judgements

1.4 In determining where we have the most scope for change within the force structure to allow necessary rebalancing and continued investment in transformational capabilities we have focused on key policy judgements from the White Paper, in particular:

- The need to rebalance and optimise our Armed Forces to meet the demands of the more likely multiple concurrent and enduring small and medium scale operations. This requires the capability to form a third line of communication including deployable Headquarters, and Command, Control, Communications, Computers, Intelligence and Surveillance and Reconnaissance (C4ISR) assets and logistics. It also demands that all deployable units should be fully manned, minimising the requirement for individual reinforcements and backfilling.
- The requirement to enhance our ability to lead or be the framework nation for European (and other coalition) operations where the US is not engaged. To do so we must

continue to have the full spectrum of military capabilities to achieve the desired effects at medium scale. For some of our assets such operations have now become the principal driver in determining the size of the force needed.

- The assumption, based on the experience of the last 10 years, that on enduring operations, once the joint force has been deployed and stability established, lower force levels and generally lighter forces are required. This has particular implications for the levels of maritime sea control, air and heavier offensive land forces required on an enduring basis.
- The assumption that the most complex large scale operations will only be conducted as part of a US-led coalition. Our primary goal is to maximise our ability to influence at all levels the planning, execution and management of the operation and its aftermath, in support of our wider security policy objectives. Our force structure at large scale should therefore focus on those capabilities which add real weight to the campaign and hence the UK's ability to influence its outcome. The most important capabilities are those which contribute to:
 - initial theatre entry and shaping operations;
 - intelligence, surveillance and reconnaissance;

- precision attack of strategic targets;
- joint land and air offensive operations; and
- post-conflict stabilisation.
- Our aim at large scale is therefore to contribute:
 - Special Forces;
 - a range of C4ISR assets, forming our own network and integrated with the US network;
 - amphibious and carrier strike task groups;
 - an air expeditionary task force capable of both long range strike and support to land operations; and
 - a land manoeuvre division capable of conducting offensive operations.

Delivering Security in a Changing World

Future Capabilities

Improved Effect through Improved Accuracy

During the Vietnam War over 800 sorties were flown against the Thanh Hoa bridge before it was destroyed by aircraft using precision weapons. Today we would aim to destroy a similar target with a single formation of 6 Tornado aircraft with Enhanced Precision guided bombs.

Improved Effect Through Improved Accuracy over the last 30 years.

Improved accuracy on target translates into a direct improvement on the desired kinetic effect and therefore we can more accurately and more efficiently achieve our military aim with minimum risk of collateral damage.

We therefore need fewer munitions, sorties and aircraft per target to achieve the desired effect.

In the 1991 Gulf War, fewer than 20% of air dropped munitions were precision guided. In Operation TELIC, greater than 80% were precision guided, greatly improving accuracy.

A Tornado GR4 dropping a precision guided munition, such as Enhanced Paveway II, will be around 10 times more accurate than it would be with a "dumb" bomb.

- Although the serious impact that the presence of a hostile submarine could have on maritime operations requires us to retain the capability to neutralise such a threat, the potential threat from hostile submarines to most future UK operations is likely to be very low. We have therefore judged it appropriate to reduce the numbers of platforms optimised for anti-submarine operations, while continuing to enhance the quality of those that remain and ensure that they are able to contribute fully in other capability areas.

- Similarly, the air threat to deployed forces has greatly reduced and the capability of our air superiority aircraft and other air defence assets is continuing to improve. So we need fewer aircraft and fewer ground-based air defence systems to meet the threat.
- The effectiveness of modern precision weapons and sensors, which can be used in all weathers, day and night, mean that highly accurate air delivered offensive effects can be achieved with fewer fast jets than before (see diagram above).
- While recognising the need to continue to provide appropriate levels of support to the Police Service of Northern Ireland, the more favourable security situation in Northern Ireland allows further reductions in the forces permanently committed to the Province, while retaining an ability to reinforce at short notice.

Methodology

1.5 In addition to routine planning, in January this year the Department set up multi-disciplinary Service and civilian teams to examine 16 thematic workstrands, using the policy baseline established by the Defence White Paper and focusing on the key judgements set out above. The aim was to identify the optimum sustainable and affordable force structure to deliver the revised policy requirement, while releasing resources to invest in our future priorities. The workstrands involved a rigorous examination of force structure, specific equipment requirements and supporting infrastructure, manpower and organisational structure. Set out in the following chapter, by capability area, are the changes we have concluded we should make to the current force structure and our key capability requirements for the future.

Chapter 2

Force Structure Changes

Network Enabled Capability

2.1 At the heart of this transformation is Network Enabled Capability (NEC). NEC is about the coherent integration of sensors, decision-makers and weapon systems along with support capabilities. NEC will enable us to operate more effectively in the future strategic environment through the more efficient sharing and exploitation of information within the UK Armed Forces and with our coalition partners. This will lead to better situational awareness across the board, facilitating improved decision-making, and bringing to bear the right military capabilities at the right time to achieve the desired military effect. This enhanced capability is about more than equipment; we will exploit the benefits to be obtained from transformed doctrine and training, and optimised command and control structures. The ability to respond more quickly and precisely will act as a force multiplier enabling our forces to achieve the desired effect through a smaller number of more capable linked assets. (An illustrative scenario showing the benefits NEC will bring to the delivery of military effect is overleaf.)

2.2 We recognise that as technology and our understanding of NEC change over time, our military capability will have to evolve. We have defined a clear set of priorities to deliver NEC over three interconnected phases, which will improve the connectivity of currently planned equipment, further integrate organisations and systems, and then synchronise all aspects of military effect.

2.3 Within the next five years there are several major programmes which will contribute to the high capacity network required to support NEC: Skynet 5 delivers the next generation of military satellite communications services to support all UK operations; Cormorant will link the strategic satellite based communications with operationally deployed headquarters, and Falcon will provide a secure communication system at the operational level; Bowman meets tactical voice and data communications needs. Building on these foundations, the Defence Information Infrastructure will provide the capability to exchange and share electronic information across Defence from foxhole to stores depot and from sensor to shooter. Elsewhere in the network, the MOD is continuing to

invest in developing stand-off sensors, such as Watchkeeper, an Unmanned Air Vehicle and improved electronic warfare capabilities such as Soothsayer. The recently trialled ASTOR airborne surveillance system will meet the Army and RAF requirement for surveillance, reconnaissance and target acquisition information, as well as providing the UK's contribution to NATO's Alliance Ground Surveillance project. Improved stand-off sensors will not, however, remove the requirement for timely and accurate human intelligence (HUMINT), particularly in the field at the operational and tactical levels. We intend, therefore, to provide additional deployable HUMINT teams.

Delivering Security in a Changing World

Future Capabilities

NEC – A SCENARIO

Autumn 2010, UK maritime, land and air forces are engaged in a focused intervention somewhere in sub-Saharan Africa.

13.54 Two fast-moving light utility vehicles carrying heavily armed terrorists with shoulder-launched surface-to-air missiles and rocket-propelled grenades are detected by an army reconnaissance squadron on patrol. They classify it as a possible target, and immediately report it to their Unit HQ using their Bowman digitally encrypted radios. ①

② 13.57 This information is quickly relayed to Brigade HQ and supporting land forces and then on to Joint Forces Land Component Command (JFLCC). Within minutes a Watchkeeper UAV, operated remotely, has been diverted to find and positively identify the target using its own sensors.

③ 14.08 Meanwhile, the JFLCC has reassigned the on-station ASTOR battlefield surveillance aircraft to track the moving target and briefs the Joint Task Force HQ (JTFHQ).

④ 14.10 The JFLCC and in conjunction with the Joint Forces Air Component Command (JFACC), develops a plan for engaging the target on the basis of an intelligence picture updated in real-time from numerous sources, which include the reconnaissance team on the ground, the UAV and ASTOR, even intelligence reports relayed from the UK by the Skynet 5 satellite system.

⑤ 14.15 Authorisation for the strike may be required from JTFHQ or from the UK, depending on the rules of engagement in force.

⑥ 14.16 Using Tactical Information Exchange Capability (TIEC) and secure voice radio, the JFACC directs an E3D Sentry to re-task two Harrier GR9 aircraft, from the nearby carrier group, who have been on stand-by in a holding pattern.

⑦ 14.24 The Harriers engage the terrorists with Maverick precision-guided munitions using updated co-ordinates received over TIEC.

⑧ 14.29 The Watchkeeper UAV provides a battle damage assessment, and confirm the destruction of the target – a little over 30 minutes from when it was first observed.

Delivering Security in a Changing World

Future Capabilities

Strategic Enablers and Logistics

2.25 Operational experience since the SDR has shown the key role of logistics and the importance of sustainability as an enabler across all elements of military capability. As with other capability areas, logistics requires strengthening in order to meet the demands of concurrent operations. There will be further significant investment in this area. As part of the re-balancing of our Army structure we are strengthening our logistic capability at brigade level, and improving deployable port and maritime capabilities, which will help meet the demands of expeditionary operations. And drawing on our experience from Operation TELIC, we are also applying the latest technology to our logistic visibility and asset tracking capability to ensure the right material is in the right place at the right time.

2.26 Fundamental to expeditionary operations is having sea and air transport, with the capacity to lift oversized loads. The core of this capability remains the fleet of C-130 aircraft, and, from 2011, the A400M. We have already announced that we are considering the options for retention of a small force of C-17s after A400M enters service, in order to maintain a capability to lift the largest air transportable items. We now intend to buy the current fleet of four leased C-17 aircraft at the conclusion of the current lease arrangement together with one additional aircraft.

2.27 The value of our fleet of six Roll-on/Roll-off vessels was amply demonstrated in the period leading up to operations in the Gulf and is crucial to achieving the rapid build up for medium scale operations. In addition the Bay Class landing ships under construction

will each be capable of deploying twice the quantity of vehicles and stores than the older landing ships which they replace.

Reserves

2.28 As set out in the Defence White Paper, the Reserves will continue to play a key role in current and future operations. In the past 10 years there has been a major change in the role and structure of the UK's Reserve forces. We are continuing this process of development and we shall remain closely engaged with Reservists and their employers (through SaBRE- "Supporting Britain's Reservists and their Employers") to ensure that the support that we provide them and the frequency of calls upon them take account of their requirements as well as our own. Our Reserve forces have evolved from a large but little used force to one that is ready and capable of providing an integrated component of Defence, structured to support more frequent expeditionary operations either as individual reinforcements in key specialist areas, or as formed sub-units. To date nearly 11,000 Reservists have deployed on Operation TELIC, with striking effect. They continue to play an invaluable part in ongoing operations, both in Iraq and across the globe.

Chapter 3

Organisation and Efficiency

3.1 In the Budget, the Chancellor of the Exchequer announced that the Ministry of Defence, in common with other Departments, was committed to a target of efficiency improvements amounting to at least 2.5% of the total Defence budget for each of the three years of the Spending Review – amounting to a target of £2.8bn by 2007/08.

3.2 It is indeed vital that we spend money wisely and make every pound count towards our defence objectives. We have constructed a robust efficiency programme that meets this target, and we are determined that the target will be met, and if possible exceeded.

3.3 Following Spending Review 2002, the key business change programmes in the Department have been brought together into a single, coherent and prioritised Defence Change Programme with strong central direction and guidance. The Programme aims to maximise investment in the front-line by modernising business systems and processes in all the areas that come together to produce operational capability. We are also developing an MOD-wide Business Management System to provide us with a framework for delivering continuous improvement in all Departmental business processes. This will enable us to drive further gains in efficiency and effectiveness, releasing more resources to the front line.

3.4 The Defence Change Programme, together with other savings identified by the thematic workstrands, form the Department's response to the cross-Government Efficiency Review. The programmes within the Defence Change Programme have been thoroughly reviewed, and plans are now in place for these programmes to deliver efficiency benefits in excess of £1.4bn (compared with 2004/05) by 2007/08. Major items include:

- The Defence Logistics Transformation Programme, which aims to improve the operational effectiveness, efficiency and flexibility of logistics support by revolutionising the delivery of support to all three Services. It incorporates the continuing work on the 'end-to-end' review of Air and Land logistic support, which examined how best to streamline support across organisational boundaries, from industry to the frontline. A successful demonstration phase validating the recommendations in the review was completed in April 2004. Work continues to develop options for the future support of military aircraft. We are also taking a new approach to the management of the Defence land vehicle fleet by adopting industry best practice, enabling a reduction of over 2,000 vehicles.
- The modernisation of military and civilian human resources management, which will deliver an enhanced service at lower cost through new systems and harmonised and simplified personnel policies and processes. These programmes will deliver considerable financial savings, chiefly through a leaner administrative function, as well as significant practical benefits, including improved tracking of Service personnel deployed on operations. For example, the rollout of the Joint Personnel Administration remains on track, starting in 2006. This will enable marked improvements, replacing legacy human resources systems and saving some 1,400 military and civilian posts.
- The Defence Information Infrastructure (DII) programme, which will provide a single modern information infrastructure across the Department, replacing over 300

separate information systems across 2,000 locations worldwide. This programme is an essential enabler for other modernisation programmes. It is also a fundamental component of Network Enabled Capability.

- Defence estate modernisation through rationalisation, more effective contractual arrangements to raise its condition and through building new accommodation for Service personnel. Our aim is to rationalise onto fewer, larger sites over the next twenty years. As part of this we will be examining our future requirements for airfields, with a view to making substantial reductions. All proposals will be subject to the normal consultation processes and the details announced once the outcome of the work is available.

Delivering Security in a Changing World

Future Capabilities

3.5 An important element of the thematic workstrands was to look at opportunities for achieving efficiencies through the rationalisation and relocation of headquarters and supporting staffs. The Royal Navy will merge the Fleet and Naval Personnel headquarters in Portsmouth. The Army is considering the scope for collocating its Land and Adjutant General headquarters. The RAF is planning to collocate its Strike and Personnel and Training Commands. Investment appraisals of the various options will be carried out in the near future to determine the most suitable locations of these collocated headquarters. We will reduce the number of MOD buildings in Central London to two; have already reduced the numbers employed in Central London to 4,900, and will continue to seek further reductions. We are considering the scope for moving elements of the Defence Logistics Organisation (DLO) to Bristol alongside the Defence Procurement Agency. We expect to reduce the number of DLO maintenance locations and make greater use of capacity freed up on operational bases that need to be retained. Changes in fast jet numbers will allow us to close RAF Coltishall airfield by December 2006 and the reduced requirement for Air Defence squadrons will permit Tornado operations at RAF Leeming to cease from 2008.

Manpower Implications

3.6 Transforming and restructuring the Armed Forces to meet the challenges of the 21st Century will inevitably lead to reductions in manpower. Royal Navy manpower will reduce from 37,500 to around 36,000 by April 2008, reflecting force level reductions and efficiencies. Once full normalisation in Northern Ireland is achieved, the bulk of the manpower from the Northern Ireland task will be available for contingent operations, allowing effective re-balancing across the Army structure and ensuring longer intervals between tours. Under these circumstances, we would expect to see an army of around 102,000, with significantly more capacity to meet the challenges of concurrent operations overseas than it has today. RAF manpower will reduce from 48,500 to around 41,000 by April 2008. This takes into account planned manpower savings arising from the introduction of new aircraft types. It also includes savings from various existing efficiency programmes such as End to End Logistics, and from the implementation of multi- and adaptive skilling, whereby individuals will be trained to undertake a variety of specialist tasks across their career, increasing flexibility. It recognises changed assumptions relating to the requirement for RAF personnel for contingent operations.

Civilian numbers will reduce by more than 10,000 by April 2008, largely as a consequence of changes introduced as part of the Defence Change Programme.

3.7 The reductions will take place over a number of years. For some of our people the changes will mean re-training. Some will leave as a result of the natural turnover of personnel but unfortunately some will need to be made redundant. We will do all we can to minimise such measures while preserving the effective age structure of the Services. We do not underestimate the impact that these changes could cause at an individual level. We will do everything possible to ease the difficulties while investing in the skills of our people at every level. It will take some time to work these measures through, but we will announce details as soon as possible. All these changes will be subject to consultation in the normal way.

Chapter 4

Conclusions

4.1 The Defence White Paper explained how we should exploit the opportunities presented by effects based planning and operations combined with highly networked and adaptable forces across all three Services. It also set out the complex nature of future threats and challenges to our security which would require our forces continually to adapt and modernise. The benchmark against which modern systems will be measured will be their ability to link up with others and exploit real time intelligence to

achieve rapid and precise effects, across the full range of threats and environments. The 2003 Iraq Conflict showed the dramatic advances our forces have made in their ability to launch expeditionary operations, achieving rapid and precise military effects in the combat phase before moving seamlessly into stabilisation and reconstruction phases. These advances have been made possible by the changes set in hand by the Strategic Defence Review, the New Chapter, and confirmed by the White

Paper of December 2003. The force structure changes set out in this document continue this process of modernisation, investing our resources in the capabilities and structures which provide flexible and adaptable high quality Armed Forces, equipped to deal with the challenges and threats of the future.

Annex

Determining the Force Structure

In Supporting Essay 2 to the Defence White Paper “Delivering Security in a Changing World”, we concluded that a single Defence Aim and 18 Military Tasks, would help to clarify the planning process. In order to translate this policy framework into a detailed basis for determining the force structure required to deliver Britain’s defence needs, we have used the methodology developed during the SDR.

Military Tasks and Strategic Effects

The first stage of this methodology is “force summation”. This involves assigning force elements to the full set of Military Tasks, taking account of the strategic effects that we plan to be able to deliver. This includes both those force elements committed to standing tasks and those that are held contingent for overseas operations. We use an effects-based approach, which enables us to be more flexible in our long-term force planning, recognising that the force structure needed to deliver effects may change over time, as threats, technology and coalitions evolve. It encourages a realistic, up to date assessment of the capability required, rather than the fixed force structure approach of the past. Analysis is based on a combination of military estimating by operational staffs and operational analysis by the Defence Science and Technology Laboratory.

Concurrency

Having established what is needed to undertake particular operational scenarios, we map the conclusions against the number of operations, of a given scale of effort and duration, that we should be able to conduct at any time - what we call concurrency. In Supporting Essay 2 we also set out our concurrency assumptions as follows:

- That as a norm, and without creating overstretch, we should be able to mount:
 - an enduring Medium Scale operation simultaneously with
 - an enduring Small Scale operation and
 - a one-off Small Scale intervention operation.
- That we should be able to reconfigure our forces rapidly to carry out:
 - the enduring Medium Scale operation and
 - an enduring Small Scale operation simultaneously with
 - a limited duration Medium Scale intervention operation.
- That, given time to prepare, we should be capable of undertaking:
 - a demanding one-off Large Scale operation while still maintaining a commitment to
 - a simple Small Scale peace support operation.
- Additionally, we must take account of the need to meet standing commitments with permanently committed forces, eg Quick Reaction Alert aircraft for integrity of UK Airspace.

Planned Force Levels

The force structure resulting from the force summation process is set out in the attached tables, showing each of the three concurrency suites. The total requirement for each force element is determined by the largest figure derived from these concurrency

permutations. The results are set out on the final table, which shows the planned force structure.

Generation Factors

A range of what are termed generation factors are required to take account of our experience of the numbers of units or force elements required to be held in the force structure to generate the number to be deployed. The main elements of these factors are:

- **Generation.**
 - For the Royal Navy this covers the ships’ training and maintenance requirement to make a ship available for scheduling.
 - For the Army this allows for those additional sub-units required to support formation training within readiness preparation times.
 - For the Royal Air Force the driving factor for fast jets is the availability of combat ready crews. This varies depending on the scale of effort and duration of commitment, and is influenced by the rotation factor described below. The number of crews required to meet any of the possible concurrency scenarios assumed for planning purposes is broadly similar, and equates to those required to meet a large scale commitment of all Fast Jet Force Elements.
- **Rotation.** To meet enduring operations whilst ensuring operational effectiveness and without placing undue strain on the personnel concerned, we must retain a pool of forces to rotate through the deployed force. Experience shows that the optimum ratio for prolonged commitments is in the region of 3 or 4 ships and 5 Army and RAF units or crew for each one deployed.

OVERALL FORCE LEVELS

Force Element	Planned Force Level
Maritime	
Aircraft Carriers	3 ¹⁵
Destroyers and Frigates	25
Amphibious Shipping	8 ¹⁶
Minewarfare Vessels	16
Strategic Deterrent Submarines	4
Attack Submarines	8
Maritime Patrol Aircraft (Nimrod MR2)	16
Land	
Armoured Squadrons	18
Armoured Recce Squadrons	13
AS 90 Batteries	15
Light Gun Batteries	9
AD Artillery Batteries	11 ¹⁷
General Support Artillery Batteries	11 ¹⁸
Engineer Regiments	11
Infantry Battalions	36
RM Commandos	3
Equipment Support Battalions (REME)	6
Royal Logistic Corps Divisional / Brigade Regiments	6
Support Helicopters ¹⁹	115
Attack Helicopters	48
Air	
Air Defence Aircraft	20 ²⁰
Offensive Support Aircraft	64 ²¹
C4ISR	
Signal Regiments	9
Sentry E3D Airborne Early Warning Aircraft	6
Reconnaissance Aircraft	3
Logistics and Strategic Enablers	
Transport and Tanker Aircraft	83
Royal Fleet Auxiliary Vessels ²²	15
NBC Regiment	1
RAF Regiment Field Squadrons	9
Field Hospitals	3

¹⁵ We plan to replace the Invincible Class with two larger vessels in the longer term.

¹⁶ 4 LSD(A)s, 2 LPD(R)s, 1 LPH and LSL (Sir Bedivere which is currently planned to retire from Service in 2011)

¹⁷ 7 HVM and 4 Rapier

¹⁸ 3 STA, 4 UAV and 4 Rocket.

¹⁹ 37 Chinook, 18 Merlin SH, 31 Puma and 29 Sea King 4

²⁰ This covers both the number of deployable aircraft and the aircraft held at readiness for the QRA air defence of the UK task, the number of the latter being unchanged.

²¹ This is the number of deployable Force Elements.

²² Excludes the amphibious ships shown separately in the maritime component.
